SUMMARY

Senior Backend Engineer with close to 7 years of experience building distributed systems, payment platforms and event-driven services working across multiple technologies with a solution-oriented approach. Experienced in technical leadership, zero-downtime migrations, high-throughput architectures and production reliability. Currently working for ixigo as a Principal Engineer

SKILLS

Java, Vert.x , WebFlux, Python , Scylla DB , SpringBoot , GoLang , Hibernate, MySql , MongoDB , Kafka, Influx , Redis, Data Structures , Postgres , Git

EXPERIENCE

Principal Engineer

July 2026 - Current , Gurgaon

ixigo

- Driving the migration of the Hotels Search Platform from MWeb to Android/iOS Native application, enabling a seamless hotel discovery experience.
- Working on the backend architecture and services for Search and Booking, supporting millions of search requests per day.
- Designing and optimizing highly scalable, low-latency backend services to improve search performance, reliability, and availability.

Senior Software Development Engineer

June 2025 - Feb 2026, Bangalore

Grab

- Payment SDK Platform : Worked on building a Payments-as-a-Platform solution for GrabFin to simplify and unify payment integrations across multiple countries. This platform abstracts the complexity of diverse regional integrations into a single interface, enabling faster and easier onboarding for teams integrating with Grab's payment systems.

Lead Software Development Engineer

Razorpay

February 2021 - June 2025, Bangalore

- Migration : Designed and led the migration of PushToPay, a core product offering on offline payment side, to a unified single-stack solution, integrating online and offline order systems for merchants to streamline operations and enhance efficiency.

- Audit : Implemented a comprehensive auditing system within the database, capturing and storing data related to all executed database queries into MongoDB. Leveraging this audit data, I developed an interactive dashboard that provides detailed transaction flow insights to business users. This significantly streamlined the debugging process for developers by expediting the resolution of smaller queries.
- Dynamic QR : Led the development of the Dynamic QR Soundbox, an integrated UPI solution seamlessly integrating with billing systems or POS machines. This integrated solution ensured error-free reconciliation and enabled instant refunds to resolve disputes arising from expired QR codes and customer account debits. It also eliminated the need for customers to manually enter transaction amounts, significantly reducing the risk of manual errors and potential fraud.
- Push to Pay (P2P) Implementation: Orchestrated the successful deployment of Push to Pay (P2P), facilitating seamless wireless payment transfers from the billing system to POS machines by creating a new microservice based on reactive Java. Scaled this solution to encompass over 700,000 devices.
- Enhanced Device Reliability: Introduced battery diagnostics for 20,000 merchants, resulting in expedited resolution of device issues and improved operational efficiency. Revamped Notification System: Redesigned and replaced the existing FCM-based notification system with MQTT-based notifications on approximately 700,000 Ezetap devices, enhancing real-time communication capabilities.
- Server Monitoring Enhancement: Implemented advanced monitoring on the org's communications exchange server utilizing time series databases (Influx) to optimize data collection and statistical analysis.
- In addition to my primary responsibilities, I actively engage in mentoring colleagues, conducting thorough code reviews, and making valuable contributions to the design of new features.

EDUCATION

Bachelors of Technology in Computer Science

SRM IST

July 2015 - June 2019 , Chennai
